

How a patient campaign runs on Hemas Connect

Prepared for Hemas Hospitals

Evaluation session • September 2026

Companion to the Corporate Profile and the Lite one-pager

One governed path from a patient's consent to a booked appointment. Every campaign — a health-check offer, a vaccination drive, a new-clinic announcement — follows the same eight steps, so marketing moves fast while compliance never has to chase it afterwards.

THE EIGHT STEPS

1 LIVE Consent Captured on the patient's first message; STOP is honoured instantly and recorded in the consent ledger.	2 PILOT Segment Choose the audience by language, department, last visit and tags — never by exporting numbers.	3 LIVE Template Only Meta-approved message templates can be sent. Sinhala and Tamil versions are submitted in the pilot.	4 LIVE Approval A named Hemas approver signs off the audience and content; the approval is hashed and kept.
5 PILOT Schedule Pick the day and time; sending is paced so Meta limits and quality rating are never breached.	6 LIVE Send Delivered through Meta's official WhatsApp Business Platform from Hemas's own number.	7 LIVE Receipts & replies Sent → delivered → read per patient; every reply lands in the team inbox for a human or the bot.	8 PILOT Report Sent, delivered, read, replied, booked — one funnel per campaign, numbers only, no message text.

LIVE demonstrated on the working platform today • PILOT delivered during the Lite pilot, sequence agreed in the discovery workshop

What you saw working today

Hemas Connect Lite • real WhatsApp line • test phones

- **A real send.** Campaign created in the portal, delivered to test phones through Meta, with each recipient turning **sent → delivered → read** live on screen.
- **Approved templates only.** The portal cannot send free text as a campaign; it offers the governed template catalogue, including an image template.
- **Consent and opt-out enforced.** A patient who sent STOP is excluded automatically and shown as excluded — the operator cannot override it.
- **Replies become conversations.** A reply to a campaign opens in the shared inbox with claim/release, so two staff never answer the same patient.
- **Fair-use quota on screen.** Campaigns per month and governed actions are real counters, not brochure numbers.
- **Hospital scale, governed.** Enterprise control centre: a 50,000-record campaign evaluated for eligibility, with an exclusion ledger and a verified approval — on synthetic data.

What the pilot adds for your marketing team

Built on the same engine • each item accepted by Hemas before it goes live

- **Segments on your real contact base.** Language, department visited, last contact date, tags, clinic — saved and reusable.
- **Sinhala and Tamil marketing templates.** Drafted with Hemas, submitted to Meta for approval, with personalisation fields (name, doctor, date).
- **Scheduling and pacing.** "Friday 9 a.m." sends, batches sized to Meta's tier for Hemas's number, automatic retry on transient failures.
- **Campaign funnel.** Sent → delivered → read → replied → **booked**, so every campaign shows appointments it produced.
- **Reminders and follow-ups from rules.** Appointment reminders and post-visit follow-ups as pre-approved automations — nothing fires silently.
- **Payment and document links** through utility templates where Hemas asks for them.

From a marketing brief to booked appointments

Prepared for Hemas Hospitals

Evaluation session • September 2026

WORKED EXAMPLE

"Invite past OPD patients in Colombo to the September health-check package, in their own language, on Friday morning." Marketing builds the segment (Colombo • visited in the last 12 months • opted in • language = Sinhala/Tamil/English), picks the approved template in each language, and submits. The Hemas approver sees audience size, exclusions and the exact message, and approves. On Friday at 9 a.m. the send runs in paced batches from Hemas's number. Replies reach the inbox; "Book" replies flow into the appointment journey. By Monday the campaign page shows how many were delivered, read, replied — and how many booked.

Meta's rules — and how the platform keeps Hemas inside them

- **Opt-in is mandatory for marketing.** Consent is captured and evidenced before any marketing template is sent; STOP is one word away.
- **Only approved templates leave the building.** Meta reviews marketing and utility templates; the platform cannot send an unapproved one.
- **Per-message billing.** Meta charges each delivered marketing message; patient-initiated conversations and service replies inside 24 hours are free. Fees pass through at cost — no markup.
- **Frequency and quality caps.** Meta limits marketing messages any one person receives per day and grows Hemas's daily sending tier with business verification and quality rating. Pacing and suppression protect the number.

Campaigns in the Lite package

INCLUDED	1 WhatsApp number • 3 portal seats • 5,000 contacts • 8 campaigns per month (fair use) • 10,000 governed actions per month
BEYOND LITE	Multi-number, multi-clinic, segments across the group and integration with LiveTrack / lab portal — the Enterprise programme, scoped in discovery
HEMAS OWNS	The number, the Meta business assets, the templates, the consent records and all patient data
PRIVACY	Campaign reports hold counts, never message text; phone numbers stay server-side; engineered for alignment with Sri Lanka's PDPA No. 9 of 2022

TO RUN THE FIRST CAMPAIGN IN THE PILOT, HEMAS PROVIDES

A named approver

One person in marketing or operations who signs off audience and content in the portal. Approvals are recorded against that name.

Approved wording in three languages

The first campaign message and the standard footer ("Reply STOP to opt out") in Sinhala, Tamil and English — we prepare drafts, Hemas approves, we submit to Meta.

The patient opt-in wording

The sentence patients agree to at reception, on the website and in the first WhatsApp reply. This is the consent evidence every marketing message rests on.

All demonstration environments run on synthetic data and test phones only. Meta template approval times, sending tiers and message fees are set by Meta and are outside SafeNet's control; figures marked "indicative" are confirmed in writing after the discovery workshop.
